

# Cased-In Wire-O

For your next project if you are:

1. Looking for the look and feel of a case bound book
2. Wanting the lay-flat benefits of a wire-o bound book
3. Needing to print copy on the spine

...Cased-In Wire-O is the style of binding you should select!

Cased-In Wire-O bound books allow for the ultimate in lay-flat binding combined with the added value of a turned-edge or hard case cover. The durability of Cased-In Wire-O is ideal for any project that requires your books to withstand repeated or long term use such as journals, cookbooks and instruction manuals.

## A three step process -

Cased-In Wire-O production involves three stages, with the first two performed simultaneously. The first step is to wire-o bind the book block. Similar to traditional wire-o binding, the books are punched and the wire is inserted through the punched holes. However, the book is bound with a one piece (wrap around) cover that is called an end sheet. The second step is to manufacture the turned-edge case. This process is performed with the cloth or offset printed/film laminated wrap being turned over the edges of binder's board to form the hard case. It is common for the case to also contain a spine board. The final step is to glue the end sheets (wrap around cover) of the wire-o bound book into the case.

Although it is as easy as 1-2-3, the Eckhart advantage is that we can engineer all three steps to ensure a perfect fit and also control all of the production required under our roof. The result is a properly constructed book that is manufactured as efficiently and economically as is possible.

As your partner in business, Eckhart & Company would love to help you plan and produce your next Cased-In Wire-O project from conception to completion. We are capable of producing Cased-In Wire-O binding efficiently and to the highest quality standards.
